

04 - Stain-proofing technologies

*The essential choice for
lasting beauty*

They protect and preserve the surface without altering its appearance.

1

What they are: Protective solutions that endow the stone surface with water and oil-repellent properties, reducing the surface absorption of staining substances.

2

Ideal for: Natural stone, marble, granite, porcelain tile, marble-concrete agglomerates, cement tiles.

3

Advantages: They preserve the material's original appearance and protect it continuously throughout all phases, including processing, transport and installation.

Characteristics:

- Reduce the surface absorption of common oil and water-based staining substances;
- Do not alter the material's appearance;
- Suitable for exteriors and interiors;
- Do not yellow over time;
- UV resistant;
- Do not substantially alter the surface's original skid coefficient.

The Technologies

The beauty of natural stone can be ruined by atmospheric agents and daily use, which may lead to stains, efflorescence and blackening. Our stain-proofing technologies are designed to offer full protection, making the treated surface water and oil-repellent. This significantly reduces the absorption of staining substances, thus improving the material's resistance to dirt and facilitating cleaning.

When applied industrially, the stain-proofing treatment also protects the material during the subsequent processing, transport and installation phases. It does not alter the stone's appearance nor does it yellow over time, while retaining its UV-resistant properties without substantially altering the surface's original skid coefficient.
